Cross Bow Laser Gauge

- stationary laser gauge, measures the cross bow on hanging strip samples
- max. measurement width for application as shown above is 600 mm; gauge can be manufactured larger to be capable of measuring wider strip
- special pneumatic holder, clamps the sample and eliminates vibration without altering the sample's cross bow
- distance between sample sheet and laser head is measured and data is sent to a PC while the laser measurement head is shifted along the sample
- cross bow of sample sheet appears as measurement curve on monitor
